- Business Continuity Plan
- Process Safety Management

Process Safety Management

Process safety is the safe operations of facilities that handle, use, process, store and/or dispose highly hazardous materials. It is accomplished through improved design, engineering, operations and protocols for change. Process safety focuses on the process equipment and chemistry to prevent system failures that may result in accidental releases, fires, explosions or injury to people. Process safety is one of two main components for total safety at the site. The other component is traditional personnel safety and occupational health which concentrate on protecting individuals from accidents and illnesses.

These two components are complementary and integrated in practice. They must be managed with full commitment using the Process Safety Management principles to achieve excellent total safety at the site.

We can assist our clients to develop and implement the process safety management element in order to ensure the total site's / installation's safety. The system will of course be tailor-made to reflect the client's organisation and business.

Our Process Safety Management services include the following :

- Process Safety Information Review & Development
- Process Hazard Analysis
- Operating Procedures
- Training Programs and Competency Development & Assessment
- Contractor Management Procedures
- Pre-startup Safety Review
- Mechanical Integrity Review and Assessment
- Hot Work Procedures
- Management of Change Procedures
- Incident Investigation Procedures
- Emergency Planning and Response
- Compliance Audits
